

DT FLEXIBOLT – Sep 2017 Improvement

The DT Flexibolt conventional grouting system is in constant development and with this comes improvements that will enhance the usability of the product and will give advantages to all current users of this product.

The following improvements have been made:

- Grouting improvements by fitting a GV nozzle connector to the conventional filler pipe and by adding a conical sponge and making the existing sponge denser.
- A longer 300mm thread and a free running nut have replaced the crimped nut and short thread. This eliminates the “turn back” of the strand that occurred at times.
- The longer thread allows for subsequent re-tensioning of the Dt flexibolt. This will reduce the number of units that must be replaced if the plates are loose after a blast, however, the shorter 150mm thread on the front or “Live” is still available for those customers who prefer it.
- Spring loaded shell allows for immediate shell activation and active support.
- An Event Indicator that gives an early warning of hanging wall convergence can also be fitted.

We would like to urge you as a possible customer to discuss the advantages and price repercussions of the DT FB V3 with your Area Manager.
