

SINGLE OR MULTI-BULBED RESIN FLEXIBOLT

The single or Multi-bulbed Resin Flexibolt is a flexible \varnothing 15.2 or 18mm compact steel cable with a bulb or bulbs (size and spacing as per customer specification) at the dead end to secure it into the back of the support hole using resin capsules. A washer, load indicator spherical seat and a 32mm Crossflat crimp or shear-pin nut are used to lock the Resin Flexibolt off and tension it to the pre-determined load at the live or collar end.

Advantages of the Resin Flexibolt:

- Easily installed and pre-tensioned either by hand held or mechanised means.
- Resin Flexibolts do not need to be cropped.
- Can be installed within 0,5m of the face before the blast.
- Resin Flexibolts and weld-mesh combinations offers a robust system that provides excellent areal coverage.
- Are available in both 15mm and 18mm strand versions with thread tensile strengths of 200 kN and 300kN respectively, at the collar.

The pictures illustrate the complete unit and the live and dead end components of the 18mm compact strand, multi bulbed Resin Flexibolt.

The Resin Flexibolts are supplied in any length and with numbers and spacing of bulbs as specified by the end users.

The Flexibolts are being installed primarily in the Platinum Mines at present with anticipated future opportunities in both the Gold and Coal divisions as well, with various derivatives.
